RE: Treatment Plan, Petr Gudkov
DOB: 1/15/1976

Dear Petr,

To treat your recurrence of Hodgkin Lymphoma you will need to receive the antibody- drug conjugate, Adcetris. The recommended dose of Adcetris is 1.8mg/kg administered as IV infusion over 30 minutes every three weeks. At this time the plan is to complete 4 cycles of treatment. Please be advised that the discounted cost of this treatment is \$17,000 per cycle. We are planning a minimum of four cycles of treatment. You will need \$68,000 to complete the planned 4 cycles of treatment. You may require more than four cycles. If you have a very favorable response to the treatment, you may then be a candidate for additional treatment in the form of an allogeneic bone marrow transplant. I understand that you are going to be pursuing a consultation in this regard at the Cardinal Bernardin Cancer Center of Loyola University Medical Center. They will provide information regarding costs for this approach, but I understand that it is likely to be greater than \$100,000.

Please feel free to contact my office if you require any additional information.

Sincerely,

Alexander Hantel, MD
